

TOSHIBA MOS MEMORY PRODUCT

2,048 WORD \times 8 BIT CMOS STATIC RAM

TC5517CP-15/CPL-15/CP-20/CPL-20
TC5517CF-15/CFL-15/CF-20/CFL-20

DESCRIPTION

The TC5517CP/CF is a 16384-bit high speed and low power fully static random access memory organized as 2048 words by 8 bits using CMOS technology, and operates from a single 5 volt supply. The TC5517CP/CF has a output enable inputs, \overline{OE} for fast memory access and output control and chip enable enable input \overline{CE} , which is used for device selection and can be used in order to achieve minimum standby current mode easily for battery back up. Also the high speed and low power characteristics which maximum access time is 150ns, 200ns and maximum operating current is 5mA/MHz are

achieved. Thus the TC5517CP/CF is most suitable for use in low power applications where battery operation or battery back up for nonvolatility are required. Furthermore the TC5517CPL/CFL guaranteed a standby current equal to or less than $1\mu A$ at $60^\circ C$ ambient temperature available. And the TC5517CP/CPL is pin compatible with 2716 type EPROM. This means that the TC5517CP/CPL and EPROM can be interchanged in the same socket, and the flexibility in the definition of the quantity of RAM versus EPROM allows the wide application in microcomputer system.

FEATURES

- Low Power Dissipation
5mA/MHz (Max.)
0.2 μA (MAX.) at $T_a=25^\circ C$
1.0 μA (MAX.) at $T_a=60^\circ C$
- 5V Single Power Supply
- Low Voltage Operation : $V_{DD}=3V$
 $t_{CO}=1\mu s$ (MAX.) $T_a=60^\circ C$
- Wide Temperature Operation
 $T_a=-40\sim 85^\circ C$
- Fully Static Operation
- Data Retention Voltage : 2.0V \sim 5.5V
- Output Buffer Control : \overline{OE}

Note:

1. R/W is high for a Read Cycle.
2. $\overline{OE} = V_{IH}$ or V_{IL} . If, $\overline{OE} = V_{IH}$ during write cycle, the output buffers remain in a high impedance state.
3. t_{WP} is specified as the logical "AND" of \overline{CE} and R/W.
 t_{WP} is measured from the latter of \overline{CE} or R/W going low to the earlier of \overline{CE} or R/W going high.
4. t_{OH} , t_{OS} are measured from the earlier of \overline{CE} or R/W going high.
5. If the \overline{CE} low transition occurs simultaneously with or latter from the R/W low transition in a Write Cycle 1, the output buffers remain in a high impedance state in this period.
6. If the \overline{CE} high transition occurs prior to or simultaneously with the R/W high transition in a Write Cycle 1, the output buffers remain in a high impedance state in this period.
7. If the R/W is low or the R/W low transition occurs prior to or simultaneously with the \overline{CE} low transition, the output buffers remain in high impedance state in this period.

PACKAGE INFORMATION FOR FLAT PACKAGE

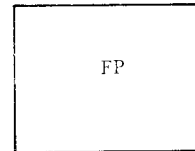

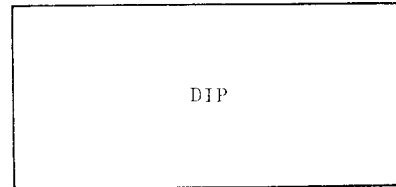

This new flat package is a very small and thin compared with conventional standard dual-in-line package. Differences are as follows.

1. Difference in dimension between flat and standard package.

	Flat package	Standard package
Length	16.5	32.4
Width	9.0	14.2
Lead Pitch	1.27	2.54
Thickness	2.1	5

Unit : mm

2. Comparison in occupied space.

3. Advantage of this package
