(common)	*IDN?	Return the ID character string: OWON <model>,<serialnum>,<version> e.g: OWON,XDM1041,12345678,V1.2.0,3
	*rst	(does not work)
SYSTem	SYST:REM	Switches to remote control: Locks the front buttons except for soft key “Local”

	SYST:LOC	Switches to local control: Unlocks the font buttons but all remote control commands still work, even in local mode																										
MEASure	MEAS?	Returns the current measured value in unformatted floating point format. No unit. If averaging is on, it returns the average																										
	MEAS1?	Returns the 2 nd function (FREQ in AC mode) in unformatted floating point format. No unit. Returns "NONE" if no 2 nd function is active																										
	MEAS2?	Returns the same value as MEAS[1 2] alone but formatted as displayed and with unit. Beware some unit symbols are not UTF-8 compatible, eg																										
	MEAS:SHOW? MEAS1:SHOW? MEAS2:SHOW?	<table border="1"> <thead> <tr> <th>Code</th> <th>meaning</th> </tr> </thead> <tbody> <tr> <td>0xa6 0xb8</td> <td>Ω (Ohm)</td> </tr> <tr> <td>0xaa 0xcc</td> <td>µ (micro)</td> </tr> <tr> <td>0xa1 0xe6</td> <td>°C</td> </tr> <tr> <td>0xa8 0x48</td> <td>°F</td> </tr> </tbody> </table>	Code	meaning	0xa6 0xb8	Ω (Ohm)	0xaa 0xcc	µ (micro)	0xa1 0xe6	°C	0xa8 0x48	°F

	CONF:TEMP:RTD type	<p>Switches to temperature mode, sensor type must be specified as below:</p> <table border="1"> <thead> <tr> <th>#</th><th>type</th><th>meaning</th></tr> </thead> <tbody> <tr> <td>1</td><td>KITS90</td><td>MIN DEF</td></tr> <tr> <td>2</td><td>PT100</td><td>MAX</td></tr> </tbody> </table> <p>Quirk: in TEMP mode with KITS90 selected, the XDM1041 will update its internal cold junction temperature reference every 600 seconds (10 minutes). During that update, it does not respond to SCPI commands for about 3 seconds but will queue the responses which are then made available once the update is complete.</p>	#	type	meaning	1	KITS90	MIN DEF	2	PT100	MAX															
#	type	meaning																								
1	KITS90	MIN DEF																								
2	PT100	MAX																								
TEMP	TEMP:RTD:UNIT unit	<p>Switches temperature unit, unit must be specified as below:</p> <p>C = Celsius F = Fahrenheit K = Kelvin</p>																								

	TEMP:RTD:SHOW type	Selects what is displayed in temperature mode, type must be specified as below: <table border="1"> <thead> <tr> <th>type</th><th>meaning</th></tr> </thead> <tbody> <tr> <td>TEMP</td><td>temperature value only</td></tr> <tr> <td>MEAS</td><td>measurement value only, e.g. resistance of PT100 or K-type voltage</td></tr> <tr> <td>ALL</td><td>Both TEMP and MEAS are displayed</td></tr> </tbody> </table> <p>Note: MEAS? or MEAS1? always return the temperature value, whatever is specified for type, however, MEAS:SHOW? returns either the temperature or the measurement depending on type. MEAS2? always returns NONE</p> <p>Bug: on SCPI if MEAS is selected. The temperature value returned by MEAS? or MEAS1? Is no longer updated.</p>	type	meaning	TEMP	temperature value only	MEAS	measurement value only, e.g. resistance of PT100 or K-type voltage	ALL	Both TEMP and MEAS are displayed		
type	meaning											
TEMP	temperature value only											
MEAS	measurement value only, e.g. resistance of PT100 or K-type voltage											
ALL	Both TEMP and MEAS are displayed											
CONT	CONT:THRE val	Specifies the resistance below which the continuity beeper will beep. Sensible values for val are integer values between 0 and 1000										
CALC	CALC:FUNC func	Selects the maths function, func needs to be as specified below: <table border="1"> <thead> <tr> <th>Func</th> <th>meaning</th> </tr> </thead> <tbody> <tr> <td>NULL (=Rel)</td> <td>Rel mode. The current value is taken as reference and subtracted from all measured values.</td> </tr> <tr> <td>DB</td> <td>Convert to dB based on selected reference</td> </tr> <tr> <td>DBM</td> <td>Convert to dbM based on selected reverence</td> </tr> <tr> <td>AVER</td> <td>Calculate max, min and average</td> </tr> </tbody> </table> <p>Quirk1: using any maths option turns the others off for that for that measurement function, i.e. only one can be active. In case of REL, the offset is lost when another math function is selected. Quirk2: To use AVER with REL, select REL first, then select some other measurement function, turn AVER on and then go back to the original measurement.</p>	Func	meaning	NULL (=Rel)	Rel mode. The current value is taken as reference and subtracted from all measured values.	DB	Convert to dB based on selected reference	DBM	Convert to dbM based on selected reverence	AVER	Calculate max, min and average
Func	meaning											
NULL (=Rel)	Rel mode. The current value is taken as reference and subtracted from all measured values.											
DB	Convert to dB based on selected reference											
DBM	Convert to dbM based on selected reverence											
AVER	Calculate max, min and average											
	CALC:FUNC?	Returns the selected CALC function (NULL, DB, DBM, AVER) if and only if it is active. Times out if no CALC function is active.										
	CALC:STAT OFF	Turns math function off (including rel = NULL mode)										

	CALC:DB:REF?	Returns the selected reference resistance for dB																						
	CALC:DB:REF val	Sets the reference resistance for dB. It must be one of the values below: 50, 75, 93, 110, 124, 125, 135, 150, 250, 300, 500, 600, 800, 900, 1000, 1200, 8000 Note: using MIN, DEF, MAX does not work. The power-on default is 50																						
	CALC:DBM:REF?	[not working]?																						
	CALC:DBM:REF val	[not working]?																						
	CALC:AVER:AVER?	Returns average																						
	CALC:AVER:MIN?	Returns minimum																						
	CALC:AVER:MAX?	Returns maximum																						
	CALC:NUL:OFFS?	Supposed to return the offset used by REL function but the value returned makes little sense (to me). Needs more investigation.																						
FUNC	FUNC? FUNC1?	Returns the current function on the main display. One of the following:																						
		<table border="1"><thead><tr><th>Return</th><th>meaning</th></tr></thead><tbody><tr><td>VOLT AC</td><td>AC volts</td></tr><tr><td>VOLT</td><td>DC volts</td></tr><tr><td>CURR AC</td><td>AC amps</td></tr><tr><td>CURR</td><td>DC amps</td></tr><tr><td>FREQ</td><td>Frequency</td></tr><tr><td>PER</td><td>Period</td></tr><tr><td>CAP</td><td>Capacitance</td></tr><tr><td>CONT</td><td>Continuity</td></tr><tr><td>DIOD</td><td>Diode</td></tr><tr><td>RES</td><td>Resistance</td></tr><tr><td>TEMP</td><td>Temperature</td></tr></tbody></table>	Return	meaning	VOLT AC	AC volts	VOLT	DC volts	CURR AC	AC amps	CURR	DC amps	FREQ	Frequency	PER	Period	CAP	Capacitance	CONT	Continuity	DIOD	Diode	RES	Resistance
Return	meaning																							
VOLT AC	AC volts																							
VOLT	DC volts																							
CURR AC	AC amps																							
CURR	DC amps																							
FREQ	Frequency																							
PER	Period																							
CAP	Capacitance																							
CONT	Continuity																							
DIOD	Diode																							
RES	Resistance																							
TEMP	Temperature																							

	FUNC2?	Returns the current function of the secondary display. One of: <table border="1"> <thead> <tr> <th>Return</th><th>meaning</th></tr> </thead> <tbody> <tr> <td>NONe</td><td>No secondary function active</td></tr> <tr> <td>FREQ</td><td>Frequency (works only Volt AC or CURR AC)</td></tr> </tbody> </table>	Return	meaning	NONe	No secondary function active	FREQ	Frequency (works only Volt AC or CURR AC)																					
Return	meaning																												
NONe	No secondary function active																												
FREQ	Frequency (works only Volt AC or CURR AC)																												
	FUNC2 “FREQ”	Sets the secondary function to frequency Bug: on SCPI the FREQ value is erroneously scaled with the range of the primary measurement <table border="1"> <thead> <tr> <th>Primary Range</th><th>Scale</th><th>50 Hz returned as</th></tr> </thead> <tbody> <tr> <td>500mV</td><td>1000</td><td>0.05</td></tr> <tr> <td>5V and above</td><td>1</td><td>50</td></tr> </tbody> </table> <table border="1"> <thead> <tr> <th>Primary Range</th><th>Scale</th><th>50 Hz returned as</th></tr> </thead> <tbody> <tr> <td>500uA</td><td>1000,000</td><td>0.000050</td></tr> <tr> <td>5mA</td><td>1000</td><td>0.05</td></tr> <tr> <td>50mA</td><td>1000</td><td>0.05</td></tr> <tr> <td>500mA</td><td>1000</td><td>0.05</td></tr> <tr> <td>5A and above</td><td>1</td><td>50</td></tr> </tbody> </table>	Primary Range	Scale	50 Hz returned as	500mV	1000	0.05	5V and above	1	50	Primary Range	Scale	50 Hz returned as	500uA	1000,000	0.000050	5mA	1000	0.05	50mA	1000	0.05	500mA	1000	0.05	5A and above	1	50
Primary Range	Scale	50 Hz returned as																											
500mV	1000	0.05																											
5V and above	1	50																											
Primary Range	Scale	50 Hz returned as																											
500uA	1000,000	0.000050																											
5mA	1000	0.05																											
50mA	1000	0.05																											
500mA	1000	0.05																											
5A and above	1	50																											
	FUNC2 “NONE”	Turns secondary function off																											
(other)	BEEP:STAT?	Returns the status of the beeper, NO [sic] for on and OFF for off.																											
	BEEP:STAT ON	Turns beeper on																											
	BEEP:STAT OFF	Turns beeper off																											
	AUTO	Turns auto range on																											
	AUTO?	Returns 0 if auto range is off or 1 if auto range is on																											
	RATE chr	Sets the measuring speed: chr must be: S = slow M = medium F = fast																											
	RATE?	Returns a character indicating the measuring speed (rate): S = slow M = medium F = fast																											

	RANGE #	The # is the number shown in the column # in the range tables. For example in resistance mode, RATE 2 selects 5KΩ Quirk: it changes range regardless of function, so in VOLT: Function: V, the command RANGE MIN changes range to manual 50mV, however if then command AUTO is send it changes back to 5V AUTO (because that is the default AUTO range for function V) To switch to 50mV AUTO use this sequence: CONF:VOLT:DC 50E-3 AUTO
	RANGE?	Returns the current range setting formatted as shown on the display. The XDM1041 does not respond to this command in DIOD and CONT mode Quirk1: Beware that some unit symbols are not UTF-8 compatible, eg “Ω” is represented as 2 bytes: 0xa6 0xb8, and μ of μF is shown as 0xaa 0xcc but uA works because it uses u instead of μ Quirk2: For temperature it returns the sensor type. e.g. KITS90
